This document is important, so please read it carefully before commencing your study in this unit.
Welcome!

Welcome to Biochemistry 233 and congratulations! You have reached an important second year unit in your progress towards your degree!

This unit is designed to expand your knowledge, develop your skills, and provide you with an introduction to biochemistry. Biochemistry is the chemistry of life and is all about trying to find out how life works at the molecular level!

Most advances in medicine, agriculture and industry evolve from an understanding of fundamental biochemistry. For example, the discovery of insulin in 1922 by Banting and Best has saved many millions of lives. A day rarely passes without the report of a biochemical discovery that benefits people.

Your achievement of the learning outcomes in this unit will depend upon your diligent efforts to keep pace with the lecture and practical content; your ability to study your text and reference materials; actively participate in all learning and assessment activities; take the opportunity to ask questions; and to explore the subject.

Take the time to read this unit outline carefully and thoroughly. It explains most of what you need to know about Biochemistry 233.

We hope you will find this unit enjoyable, challenging, and rewarding. We particularly hope that it stimulates your interest in biochemistry and the biomedical sciences to the extent that you go on to pursue your studies at a higher level.

All the best and enjoy!

Dr Steven Bottomley
Unit Coordinator
Biochemistry 233
Aims

Molecules are the principal building blocks of life. Their structure, function and organisation are the basis of biochemistry. This unit is designed to provide you with a broad theoretical and practical introduction to the biochemistry that underpins courses in biology, medicine, dentistry, nutrition, veterinary sciences, and pharmacy. We have also designed this unit to help you develop your thinking, practical, and affective skills.

Unit Coordinator and Lecturers

Your unit coordinator is Dr Steven Bottomley. If you have any questions or requests specifically relating to your ability to conduct Biochemistry 233, then you should contact your unit coordinator. Your lecturer for this unit will be Dr Steven Bottomley and possibly other invited lecturers or practical demonstrators.

Availability of lecturers

Biochemistry lecturers are always approachable and welcome your questions. Do not be afraid to ask the lecturer questions. However, please be aware that the demands on a lecturer’s time are very great and the lecturer may not be able to respond immediately to your question (either from a personal visit, telephone call, email, or note). Please also note that the university has limited a lecturer’s time for all activities including the activities of consultation, assessment, and feedback (see later).

Generally, all biochemistry lecturers have an ‘open door’ policy. This means that the lecturers are available at most times during semester for student consultation and questions. However, this does not mean that you can ‘barge in’ and demand attention at any time you like. It is polite to enquire if the lecturer is available to meet with you. If the lecturer can’t see you immediately, or you need to establish a definite time for the meeting, then you will be required to make an appointment. There may also be times during semester where the lecturer, for whatever reason, is unavailable for any student consultation.

If for some reason, you feel you can’t approach the lecturers in person then take advantage of the other ways of communicating with lecturers such as: telephone, during class (by asking questions), by the Blackboard bulletin board, by Blackboard email, internet email, or even by a note left in the lecturer’s mail box (found outside the office on the ground floor in Building 308)!
Learning Biochemistry, Thinking Skills, and Unit Learning Outcomes

There are various ways to describe and explain how people learn. One popular way proposes that there are three categories of learning: Cognitive (thinking skills), psychomotor (manual and physical skills), and affective (feelings and emotions). That is, you learn by thinking, doing and feeling! Much of Biochemistry 233 will focus on helping you develop your thinking and manual skills in biochemistry. Most of these skills will be directly assessed as outlined below.

Unit Learning Outcomes – Thinking Skills

Learning outcomes are a useful guide for you to know what to expect from the unit and what to expect from yourself. You may forget some of the content of biochemistry in the future, but the thinking skills you develop in this unit will last you a lifetime. This is called ‘lifetime learning’. Both theoretical and practical aspects of biochemistry are covered.

At the completion of this unit you are expected to achieve the following learning outcomes for your thinking skills:

1. Remember and understand biochemical facts, principles, techniques, and concepts
2. Apply biochemical knowledge to solve problems
3. Analyse and evaluate biochemical knowledge and data
4. Create multiple-choice questions on biochemistry
5. Plan and write a laboratory book

Your achievement of these learning outcomes will be assessed by a combination of online tests, laboratory activities, and the PeerWise assignment.

Unit Learning Outcomes – Manual Skills

In addition to thinking skills you will also develop your manual (practical) skills such as:

1. Competent, professional, and safe use of laboratory instruments
2. Competent, professional, and safe performance of biochemical techniques
3. Competent use of a computer for data analysis and molecular visualization

Your laboratory book will be used as the principal assessment of you achieving these outcomes. However, online assessments may also be used to assess your achievement of these outcomes.

Unit Learning Outcomes – Affective Attributes

Affective attributes such as: awareness, politeness, active participation in class, working both cooperatively and independently, taking responsibility for your own learning, and organizational ability will not be formally assessed (that is you don’t receive a grade), but are ‘noticed’. What use is this to you? Well, if you require a reference from your lecturer or unit coordinator for a potential employer, scholarship application, or

---

professional position then the lecturer may use what they remember of your affective attributes when providing the reference.

Developing Self-Knowledge in Biochemistry

It is a good idea to constantly ask yourself how you are approaching your study in biochemistry. Think about your strategies for study and learning in biochemistry. Reflect on what you do and how you could do something better or differently. Question what you do, how you do it, and why you do it! You may use your laboratory notebook, or any other notebook (or computer) as a place to record your reflections.

Syllabus

This syllabus is covered throughout semester by a combination of lectures, assignments, practicals, and feedback sessions. You are also expected to take an active role in your own learning by organizing your own reading and studying for greater understanding.

Unit Materials

Textbooks and References

The recommended textbook for this unit is:

The earlier edition of this textbook will also suffice. This textbook contains most of the biochemical knowledge needed for this unit and closely follows most of the syllabus. However, no textbook is ‘perfect’ and you will need to use other textbooks, journal articles, and various other resources to help you with your learning. Other textbooks and references you may find useful include:

The library has some of these and other books on biochemistry, so visit your library. Some biochemistry textbooks can be borrowed from the School and are kept in a locked bookcase in building 308 on the first floor. You need to see the School secretary to borrow books. Various other resources to help you with your study include journal articles, the internet (some useful web sites are listed below, in the study guide, and on the Blackboard site), your friends, colleagues, tutors, lecturers, and professional people you know.

**Web-Based Resources**

You will be referred to various resources, including course notes, information, and practice assessments on the World Wide Web. In particular, you will need to gain access to Curtin University’s internet teaching platform called Blackboard. You should now be able to effectively explore the internet where there is a wealth of freely available information. You may also be referred to some web sites during the course of your study. **Please Note:** When using the internet you must ensure that the source of information comes from a reputable, qualified, and professional institution or person.

Useful web sites include:

- Biochemistry 233 Blackboard site. This can be accessed from your Oasis account or from http://lms.curtin.edu.au
- Curtin University library have various guides for study and research skills see: http://library.curtin.edu.au/study-and-research-tools/index.cfm
- School of Biomedical Sciences Biochemistry web site: http://www.biomed.curtin.edu.au/
- If you use the Harvey & Ferrier. (2011) *Biochemistry* textbook then each text has a code on the inside of the front cover to access the text book’s web site

**Learning Aids**

The learning aids for this unit are extensive and include:

- Your textbook
- Your lectures, ilectures, and Adobe Acrobat (pdf) files of lectures
- The various web-based resources listed above
• ‘Questions for learning - online’. These are various online (via Blackboard) multiple choice, and short answer, questions that cover the unit syllabus and learning outcomes.
• ‘Questions for learning – practicals’. These are various short answer questions provided in your laboratory study guide or through your laboratory activities.
• ‘Questions for learning – lectures’. These are various multiple-choice or short answer questions given during some of the lectures.
• PeerWise Assignment (see PeerWise later).
• Feedback and tutorial sessions. These are given usually during a scheduled practical session to review the laboratory activities and other aspects of the subject.
• The Laboratory Techniques Study Guide
• Acid/Base Chemistry FAQ (Frequently Asked Questions) notes (on Blackboard).
• Revision of organic chemistry notes (on Blackboard).
• Interactive tutorials and resources at the School of Biomedical Sciences Biochemistry web site at: http://www.biomed.curtin.edu.au/biochem/
• Molecular visualisation program.
• Blackboard bulletin board and email.

You should make use of these aids to complement and enhance your own learning. Please note that ilectures are audio only and are provided to complement your lectures. You should note that ilectures may not be available due to various unforeseen problems with the recording equipment or mistakes in organization. You are still responsible for making your own notes during the lecture.

Lectures, Practicals, Tutorials, and Study Load

This unit requires at least 5 hours per week allocated as follows:

• Lecture 2 x 1 hour
• Practical/Laboratory activities/Feedback/Tutorial Sessions 1 x 3 hours

Lectures

Attendance at all lectures is strongly recommended. Why? Well, the lecturer may cover material in a slightly different way or have a particular emphasis on some concepts that will not always be obvious in the online lecture presentations or textbook. The lecturer may also cover material required to answer online assessments. Lectures also give you a convenient opportunity to ask your lecturer questions, to meet with your fellow students, and discuss the subject with your colleagues. Most of the lecture presentations are available on the Blackboard site as an ilecture and as an Adobe Acrobat (pdf) document.

Lectures are continually modified and updated. Consequently, some lectures may not yet be available on the Blackboard site. Where lecture notes are not provided it is still your
responsibility to write your own lecture notes! In fact, even if lecture notes are provided it is still your responsibility to write your own lecture, and study, notes!

Please understand the following:

- please do not always expect a lecture to always be a ‘one-way’ learning experience (lecturer to you) where you can ‘sit back and relax’. You will be expected to think and to contribute during the lecture through activities such as: answering questions, asking questions, providing feedback, performing calculations, and applying your knowledge. The lecture then becomes a more active and involved ‘two-way’ learning experience that will help you!
- lectures may not be sufficient study material to help you pass this unit! That is, you may need to do additional study if, for example, you do not have appropriate knowledge of chemistry or biology.
- lectures should be viewed as your study guide to each topic.
- parts of the syllabus may not be presented as lectures (e.g. as practical laboratory activities), but you still need to study and know this subject matter.
- it is essential that you read the appropriate chapters in your text, other books, or other credible sources of information before and after each lecture.
- not all questions in your assessments can be answered by simple regurgitation of lecture content. For example, problem solving questions will require you to integrate and apply your knowledge. (Please read the learning outcomes).
- your attention in the lecture is important for your learning. Consequently, please don’t attend the lecture if you intend to talk with your friends about other things or if you want to ‘sleep’. Any unnecessary, disruptive, or unrelated activity by students during lectures may result in the embarrassment of the student(s) being asked to leave the lecture.

Your understanding of each topic will only be achieved satisfactorily with broader reading of your text and other reference materials. Remember, it is your understanding of the topics that will be assessed in this unit! You may also find that you need to study more (or less) than other students depending upon your existing knowledge and ability. Please understand that ultimately you are responsible for your own learning!

We continually review the content of Biochemistry 233 in an attempt to keep it up to date, to implement new teaching and learning approaches, to (hopefully) make it interesting, and to account for the varying academic backgrounds of students. Consequently, lecture and practical content may be changed at any time at the discretion of the lecturer or unit coordinator. The subject of a lecture may be given earlier or later than that shown in the indicated schedule. Some lectures may also be extended or curtailed. These changes may also depend upon the perceived progress of the student cohort and other factors. However, these changes are always made with the intention that you will benefit from a better learning and teaching environment. You will also be notified of any changes that may affect assessments.

The academic background and capabilities of students entering second year at university does vary considerably each year. These differences may be due to students entering the unit with a different high school education, from a different faculty, from other institutions (local or international), or after some absence from education (e.g. as a parent returning to education after rearing children). Consequently, you should try to be
considerate towards these other groups of students in your student cohort and try to understand why these changes need to be made (affective skills!).

**Special note:** We aim to conduct a gradual revision of the Biochemistry 233 syllabus, and teaching approach, starting 2011 with a complete revision likely to take a couple of years. Consequently, you may find that you are asked for your feedback on any potential change in syllabus. You may also find changes occurring in lecture content, timing, or teaching approach throughout the semester. We cannot conduct this revision before the semester starts or during the ‘semester break’ because there is not enough time. The ‘semester break’ is often used for activities such as: student assessment (after semester), administration, various meetings, or research. We would also not be able to receive feedback from students during semester break.

**Practicals**

The practicals will comprise both ‘hands on’ and theoretical exercises to develop your thinking skills, manual skills, and help you achieve your practical learning outcomes (see above). The practical usually commences with a short outline of the practical session and a few questions.

**Important points to note about Practicals:**

- The practical sessions will be organized as a series of laboratory activities. The activities may include such things as: calculations, writing, critical thinking, experiments, manual skills, and answering questions.
- You should attempt all laboratory activities and record the details in your laboratory notebook. You should use your laboratory book, and any additional documentation that may be provided, to record your laboratory activities. Any additional documentation you may use for practical activities should be fixed (by glue or staples) into your laboratory book.
- You will need to read the Laboratory Techniques Study Guide and practical notes before attending the class and complete any pre-lab activities.
- You should use all of your time in the laboratory to complete the required practical activity.

Practical sessions are conducted in either the ‘wet labs’ in 310.103 or the ‘Mac Lab’ in 308:104 according to the study schedule. Attendance at practical sessions is essential because, as a biomedical scientist in medical science, molecular biotechnology or human biology you need to learn the requisite laboratory skills.

The laboratory officer for Biochemistry 233 will ensure that you have all the materials for your practical. Please note that at least one staff member (usually the laboratory officer, a laboratory demonstrator, or lecturer) will be available at all times in the laboratory area during the practical session.
**Safety in Practicals**

The correct clothing must be worn to all laboratory sessions and the safety regulations must be observed at all times. Safety regulations are posted in the laboratory. These regulations are to help maximize your safety, so please ensure that you read and understand the regulations. Minimum safety clothing includes covered shoes, a full-length laboratory coat (covering arms, torso, and down to the top of the knees), and latex gloves when necessary (gloves will be provided in the laboratory). Laboratory coats are provided for you and cannot be taken out of the laboratory. Some practical procedures may also require safety spectacles. Students not wearing the required safety clothing, or not following the safety regulations, will be dismissed from the class and be required to leave the laboratory immediately. The supervising staff member may permit the student to return to the same class (within one hour of the start of the class) only if they have complied with the appropriate safety clothing and regulations.

**Feedback**

Feedback occurs when information is exchanged between you and your lecturers. You provide information to help the lecturers learn more about you, your knowledge, or correct any misunderstanding. Your lecturers provide you information to help you learn, correct any misunderstanding, or clarify what you need to do.

Feedback can occur at any time during semester either in class or out of class. In fact, there are specific ‘Feedback’ sessions during the practicals (as shown on the schedule). These feedback sessions are essential and are an excellent opportunity (in a relatively small class) for you to ask questions and both give and receive feedback on your laboratory activities, lectures, and assessments. These sessions can be a very useful way to receive guidance and clarification on the entire syllabus. The activities in the feedback session will vary and may include: study activities, discussion of lectures, practicals, and assignments. The time taken for these sessions is variable and will depend to a certain extent on student participation. However, it will be no more than a usual practical session of three hours. You MUST take feedback seriously and don’t be afraid to ask questions!

Feedback ‘out of class’ can occur through Curtin’s Blackboard learning management system (e.g. Announcements and the Bulletin Board) by any other form of acceptable communication (e.g. email or personal appointment). You can also provide more formal feedback on your perceptions of the unit, and lecturers, through Curtin’s eValuate system.

**Tutorials**

Tutorials may also be given in some of the practical sessions and may occur in addition to, and at the same time as, the feedback sessions. These tutorials may comprise additional activities that are designed to help you learn particular aspects of biochemistry.
**Study Load**

You will need to spend **at least 4 to 5 hours a week** outside of scheduled classes studying in this unit to be successful. You may need more time if you don't have an appropriate background in chemistry.

**Time allocated to Consultation, Assessment, and Feedback.**

This unit involves assessment (designed and managed by the unit coordinator) and feedback through tutorials, lectures, and assessments. All lecturers, and the unit coordinator, in this unit are also available for personal consultation.

However, you should be aware that there are time constraints on the important activities of consultation, assessment, and feedback. This has arisen due to Curtin University recently implementing an Academic Workload Management System to manage and audit academic workloads. This system allocates time to various academic activities or duties (e.g. four hours for each lecture preparation and presentation). Currently only 1 hour per student has been allocated in this unit for the combination of consultation, assessment, and feedback activities.

**Assessment**

Assessment in Biochemistry 233 is designed with the following aims:

- to help you learn biochemistry
- to give you various opportunities to demonstrate your learning and achievement of the learning outcomes. That is, your achievement in Biochemistry 233 does not depend upon just one ‘end of semester’ exam.
- reward your performance for achieving the learning outcomes
- allow you to study continuously rather than ‘cram’ at the end of semester
- provide appropriate and timely feedback
- discriminate between those students who do the work and those who do not
- establish, maintain, and protect internationally recognised academic standards

A summary of the assessment descriptions and requirements are listed in the following table. If you work diligently you will find that all of the assessments are achievable during semester.
Biochemistry 233 Assessment Summary*

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
<th>Requirements</th>
<th>% Total Semester Mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>Two Semester Online Assessments</td>
<td>Satisfactory completion of two unsupervised, 'open book', semester online assessment on topics in the biochemistry syllabus. Scheduled for week 5 and week 11 of semester. Automatic assessment and feedback is given within two days after completion of the assessment.</td>
<td>Satisfactory completion means that you achieve at least 50% of the assessment mark. That is, at least 7.5% of your total semester mark for each assessment.</td>
<td>2 x 15 = 30</td>
</tr>
<tr>
<td>End of Semester Online Assessment</td>
<td>Satisfactory completion of a supervised end of semester online assessment on topics in the entire biochemistry syllabus. Automatic assessment and feedback within two days after completion of the assessment</td>
<td>Satisfactory completion means that you achieve at least 50% of the assessment mark. That is, at least 17.5% of your total semester mark is required for the end of semester online assessment.</td>
<td>1 x 35 = 35</td>
</tr>
<tr>
<td>Laboratory Activities</td>
<td>Satisfactory completion of all laboratory activities during semester. Must present results of activities in a written laboratory notebook that is always available for inspection during practical sessions.</td>
<td>Satisfactory completion means that you achieve at least 50% of the assessment mark. That is, at least 10% of your total semester mark is required for this assessment.</td>
<td>1 x 20 = 20</td>
</tr>
<tr>
<td>PeerWise Assignment</td>
<td>Satisfactory completion of PeerWise assignment according to specific marking criteria. PeerWise is conducted throughout the semester. Further details of the PeerWise assignment is given in the unit outline and in separate documents.</td>
<td>Satisfactory completion means that you achieve at least 50% of the assessment mark. That is, at least 5% of your total semester mark for this assignment.</td>
<td>1 x 10 = 10</td>
</tr>
<tr>
<td>Concept Surveys</td>
<td>Satisfactory participation in concept surveys at the beginning and end of semester. There will be no score with these surveys</td>
<td>Satisfactory participation means that you are conscientious and that you attempt ALL questions in the survey to the best of your abilities.</td>
<td>1 x 5 = 5</td>
</tr>
</tbody>
</table>

**Total Mark**                                                                                                                                   | 100

*Details of the assessment may change at any time at the discretion of the unit coordinator. However, you will be notified of any changes.

**Important Notes about your assessments**

In accordance with Curtin policy, you are advised that this unit is a **significant unit** in which failure twice may lead to termination of your course. You are required to attempt **all** components of the assessment. Failure to attempt one, or more, components of the assessment, where there is no valid reason for the lack of an attempt, may result in a 'Failed-Incomplete' (F-IN) grade being allocated at the end of semester regardless of the total mark achieved.

**Extensions**

Extensions of time for taking any of the required assessments are not usually possible. If there are any extenuating circumstances (such as a medical emergency) then alternative
arrangements may be made on a case-by-case basis. However, evidence must be provided such as a dated, and signed, medical certificate.

**Late Submissions**

Any unauthorized late submission will result in a decrease in marks of at least 10% of the assessment mark for each day overdue. For example, if an assessment is worth 20% of your total semester mark then the penalty for two days overdue would be: 

\[ 2 \times (10/100 \times 20\%) = 4\% \]. Thus, the total mark available for the assessment would be: 20-4=16%. This does not mean you would receive 16% because it would depend upon the quality of your submission according to the marking criteria.

**Supplementary Assessments**

If you fail the unit then you may be offered a supplementary assessment. Supplementary assessments are awarded only at the discretion of the Board of Examiners. They are not an automatic right and the Board of examiners will carefully review each individual case. The aim of a supplementary assessment is to allow the student a chance to correct minor problems or deficiencies in the initial assessment and not to gain extra study time or correct major problems. The number of supplementary assessments awarded for each student will be kept to a minimum for a study period and a particular course of study.

Supplementary assessments, if awarded, will be indicated on the official Curtin examination result statement posted to all students, and will also be listed on the School notice board about 24 hours after the Board of Examiners meeting. It is your responsibility to check your status. A student who does not take a scheduled supplementary assessment has no claim to a further assessment. If you are awarded a supplementary assessment it is imperative that you confirm the type, and schedule, of the assessment. Assessments may be in any appropriate format including: multiple choice questions, short answer, essay, or project. The unit coordinator will determine the type of assessment after consulting with lecturers and the Board of Examiners.

**Deferred Assessment**

Deferment of an assessment is not automatic. Students may be permitted by the relevant Board of Examiners to defer an assessment for circumstances outside of the student’s control. However, a student’s overall performance may be taken into account in granting permission to defer an assessment. Applications for deferment on health grounds or as a result of extenuating circumstances must be submitted not later than seven (7) days after the end of the relevant assessment was due to be submitted during the semester. Detailed medical certificates should be attached to the application where appropriate.
Assessment Details

Semester Online Assessments

You must complete two unsupervised, ‘open book’, online assessments using Curtin’s Blackboard learning management system (LMS). Each online assessment is worth 15% of your total semester mark. The two online assessments are scheduled at different dates during semester and are a continuous assessment designed to help guide your learning throughout the semester. The first online assessment will cover the entire syllabus up to the date of the assessment. The second online assessment will include the entire syllabus up to the date of the assessment. The proposed schedule of assessments is shown in the study and assessment schedule on the last page of this unit outline.

Important points to note about the semester online assessments:

- The assessments can be taken online either on or off campus (eg. at home). All you need is a reliable computer, a stable internet connection, and access to Curtin’s Blackboard LMS (which also requires your Oasis password).
- The assessments are unsupervised and ‘open book’
- The assessments will comprise up to 50 multiple choice questions although other types of questions such as short answer questions may also be used.
- The assessments will be open at a particular time and date. They will remain open for about 3 to 5 days (you will be notified of the exact duration near the commencement date). You can sit the assessment at any time within the time the assessment is open.
- You may submit your assessment up to six times after the assessment is open. This means you have time to think about the questions and have a chance to correct any mistakes. However, you will not receive a score or feedback after each individual submission and only your final submission will be marked.
- You should leave yourself enough time to complete the assessment. You should not leave the assessment until the last minute to complete.
- Feedback, correct solutions, and your score for your submitted assessment will be provided usually within 24 to 48 hours after the assessment has closed.
- You must work individually on the assessment. If any collaboration is discovered then all students involved will receive a zero mark.
- Your feedback about the assessment is welcome – especially if you think a question is ambiguous or a wrong answer is given. We may discuss questions that most students find challenging during class, the practical feedback sessions, or through Blackboard’s discussion board
- You must immediately report any technical problems that deny you access to the assessments during the time the assessment is open. If a report is not received then no further action will be taken.
- Once an assessment has been closed it will not be reopened. Consequently, you must ensure you sit the assessment within the time and date specified in the schedule.
End of Semester Online Assessment

The end of semester online assessment will be a supervised exam. The assessment will comprise up to 100 questions. These questions will be mostly multiple choice but other types of questions such as short answer may be used. This assessment covers the entire syllabus of Biochemistry 233 and will be conducted in the MacLab (308:104) at the time of your usual practical session. You have one attempt at the assessment.

**Important points to note about the end of semester online assessment:**

- No collaboration, books, or notes are allowed during online assessment either in printed or electronic form unless otherwise stated.
- Only the online assessment web site is to be open during the assessment. No other computer programs or internet sites should be open during the online assessment. The only exception is the computer’s own calculator or an application needed for the assessment and approved by the lecturer.
- Only simple, non-programmable, calculators are allowed during online assessment.
- Mobile phones should be turned off and not used for any reason during the assessment.

If a student is found to contravene any of these points then it may result in the student receiving zero marks for this assessment.

**Laboratory Activities Assessment**

The laboratory activities are an important part of your learning. Scientists take the time to carefully record all of their experimental work. This helps them organize their work, communicate their results to other people, and provide evidence for any potential patent application or intellectual property position. You are learning to be a scientist, so you must take this issue seriously. Consequently, you will be assessed on your contribution during the practical sessions.

Your laboratory notebook can be inspected anytime during semester to assess your progress and give you feedback. Consequently, your laboratory notebook always needs to be up to date. You need to submit your completed laboratory notebook at the end of semester.

Your laboratory notebook and all laboratory activities, experiments, and questions will be finally assessed at the end of semester. In most practicals you will work with a partner or group. However, your practical notebook must contain your own work and not simply be a copy of your partner’s (or other people’s) notes. The specific criteria that will be used for marking your laboratory notebook are given in your practical notes.

**PeerWise Assignment**

PeerWise is a specialized web-based system that is unique, and innovative, way to learn biochemistry and develop your thinking skills. It is said that you ‘learn by teaching’ and that is exactly what you will do with this assignment. You will research, design, and write your own multiple choice questions (MCQ). You will use the web-based system to write
your question, the distractors (incorrect answers), the correct answer and feedback. Your questions will then be subject to review by your peers. You will also review other student’s questions using PeerWise.

You will write at least 4 MCQs according to the requirements and peer review 8 other questions written by other students. Points will be awarded based upon your contributions and the assessment of your questions by your peers. More details of the PeerWise assignment will be provided in a separate document on Blackboard.

**Concept Surveys**

Concept surveys are a new, alternative, and important ‘tool’ that you and your lecturers can use to determine if learning has been achieved in biochemistry. Your participation in the Concept Surveys is optional and achieves the following:

- provides you with an insight into biochemical concepts
- provides you with feedback of your learning (other than the formal assessments) in biochemistry during semester
- provides the lecturers and unit coordinator with insight on the types of things that students may not understand, are confused, or unclear about in biochemistry.

You should note the following about concept surveys:

- Concept surveys will consist of up to 50 multiple-choice questions covering a range of concepts that are believed to be important in biochemistry.
- You have the option to participate in two concept surveys: one at the beginning of semester and one at the end of semester. The concept survey at the end of semester is the same as the concept survey at the beginning of semester.
- Your answers to the questions in the concept surveys will NOT count towards your final semester grade
- Only your conscientious participation in the surveys will be rewarded with a mark
- You will not be given the answers to the questions in the concept surveys because they will be used with future students of biochemistry and it is important that the answers are not released to students.
- You will not receive a final mark for your answers to the surveys, but you may receive some indication on your learning progress as measured by the surveys.
- Participation in Concept Surveys is optional and subject to your consent. Consent will be sought at the beginning of each Survey.
- If you chose not to participate in the concept surveys then the mark for the survey will be added to the mark for the laboratory activities. This will then become a graded mark.

**Questions for Learning**

‘Questions for Learning’ are multiple choice, and short answer questions, that are not formally assessed but can be used to help you learn, to determine ‘what you need to know’ for the online assessments, and to help you achieve the learning objectives. These ‘Questions for Learning’ can be found online (Blackboard), in lectures, and in practicals
(both as class activities and as written questions in the Laboratory Techniques Study Guide). In particular, you can use the online ‘Questions for Learning’ to practice for the online assessments. You can choose to answer as many ‘Questions for Learning’ as you like: The more questions you answer the better your knowledge and the better prepared you will be for your assessments – it is up to you! Please note that all ‘Questions for Learning’ will be removed from Blackboard about two to three days before the commencement of the online assessments and the online end of semester assessment. They will be available again shortly after each online assessment has closed.

**Mobile Phones**

As a courtesy to both lecturers and other students, if you have a mobile phone, please ensure that it is turned off, or muted, during lecture and practical sessions. Mobile phones should also be turned off and not be used for any reason during supervised assessments. Students who do not comply with this request may be asked to leave the class.

**Plagiarism Policy**

Collaboration with other students is encouraged, but the submitted assignments, and assessments, must be YOUR OWN WORK. Consequently, you must be careful to appropriately cite all references you use in your answers to any assessment or assignment questions. **Collusion or plagiarism will not be tolerated.** Please note that electronic checks may be made on any submitted written assignment using specialist software that detects significant similarities and known references.

It is not acceptable to simply copy the words of other students or authors when completing any assessment or assignment in this unit. This action constitutes plagiarism and is regarded as academic malpractice. The penalties for plagiarism can be severe and may include termination from your course of study. All direct quotes must be correctly attributed to the author and should be kept to a minimum. Also, you should include a list of references to acknowledge the source(s) of information used to produce any written work. Curtin University's policy on academic (student) integrity and plagiarism can be found at: [http://academicintegrity.curtin.edu.au/studentbook.html](http://academicintegrity.curtin.edu.au/studentbook.html)

**Student Rights and Responsibilities**

You are responsible for your own learning. It is also important for you to read and understand the following statement²: “It is the responsibility of every student to be aware of all relevant legislation and policies and procedures relating to their rights and responsibilities as a student. These include: the Student Charter; the University’s Guiding Ethical Principles; the University’s policy and statements on plagiarism and academic integrity; copyright principles and responsibilities, the University’s policies on appropriate use of software and computer facilities; students’ communication with students. Further information is available at: [www.students.curtin.edu.au/rights/](http://www.students.curtin.edu.au/rights/)
